Research Overview

Human life is organized around groups, from families and teams to classrooms and institutions. Increasingly, robots and AI are entering these social settings, where they do more than perform tasks: they *participate in* and *reshape* how groups communicate, coordinate, and make decisions. Their presence generates new forms of **hybrid collective intelligence** that integrate human and artificial capabilities to expand what groups can accomplish. Thus, my research vision is to help architect the future of hybrid collective intelligence by advancing both the *computational methods* for designing human–agent interaction in group settings, and the *behavioral understanding* of processes within human–AI groups.
